

Introduction to Computer Programming (ICP, CCIT4020)

HKU SPACE Community College, 2021-2022 Semester 1

(Lab 06)

(Practicing Lab, NOT for submission)

Review the related lecture note(s), and finish exercises below.

1.
 - Write a Python program (named **Lab6_1.py**) with function **main()** to 1) ask user to input a string, an integer and a float; and store them in different variables (**name**, **n1**, **n2**) of types **str**, **int**, and **float**; 2) then properly call the **dispSum()** function below.
 - Also write a function **dispSum()** in the same file, which:
 - Accepts **3 parameters**: (**name1**, **num1**, **num2**)
 - The function body should add the two input numbers, and display a message as below.
 - **No return** value is needed.

Sample Program Output

What is your name? Andy

Enter an Integer: 132

Enter a Float number: 40.2

Hi, Andy!

The sum of numbers 132 and 40.2 is 172.2

User Input Done in
main() function

Display Done
in function
dispSum()

2. Create our own module:

- Write a function named **totsecs()** only, in a file (Python module) named **Lab6_sec.py**. The **totsecs()** function:
 - accepts **3 input parameters**: the time in variables named **hours**, **minutes**, **seconds**
 - determines/calculates the total number of seconds, and
 - **returns** this calculated result.
- Write a Python program file (named **Lab6_2.py**) with a function **main()** to:
 - Import the module above by one of the following methods,
e.g1. `import Lab6_sec` # standard import method
e.g2. `from Lab6_sec import *` # or alternative method1
e.g3. `from Lab6_sec import totsec` # or alternative method2
 - ask user to input hours, minutes and seconds and store them in different variables in integer type named: (**hour**, **min**, **sec**)
 - call the **totsecs()** function above (from a module we created) to get its calculation result,
 - display the returned result as sample output.

* Reminders:

- Call the **main()** function for starting execution.
- There should be 2 files created for this lab. section: **Lab6_sec.py** and **Lab6_2.py**

Sample Program Output

Enter the number of hours: 12
Enter the number of minutes: 24
Enter the number of seconds: 36
The total number of seconds is 44676

A red dashed box highlights the input values 12, 24, and 36. A red arrow points from a box labeled "User Input" to the value 24. A yellow arrow points from the final output line to a box below.

Result obtained from function
totsecs() of module Lab6 sec
