

Webpage Programming and Design Assignment #2

(CCIT4058) AY22-23 **S2**

Customizing your website with DHTML (HTML / CSS / JavaScript)

This assignment contributes 15% of your total course mark.

Submission deadline is as follows:

Due date: Refer to SOUL's information. No late submission will be accepted.

Introduction – For Your Eyes Only (FYEO) Company Limited

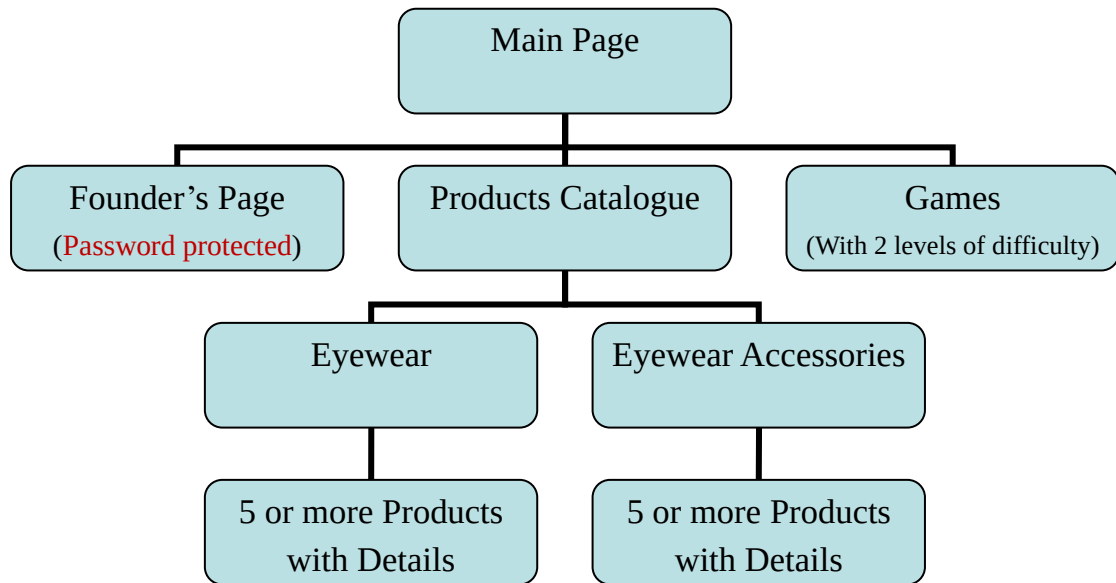

You are the web designer, and your task is to create a web site for a company that specializes in Eyewear and Eyewear Accessories to promote the company's image and products.

In this regard, you are to provide relevant content to support your web page design.

The contents should contain both images and textual descriptions presented in DHTML / JavaScript technologies for at least five different kinds of products for each of the Eyewear and Eyewear Accessories categories.

Web site structure specification

The top menu (main page) should provide a catalog of product categories for customers. The catalog should be classified as two different sub-categories as shown in the following schematic diagram:

In each product category (i.e., **Eyewear** and **Eyewear Accessories**), you should provide information about the products. For example, in the eyewear products page, you should present information about 5 or more different kinds of eyewear in form of text and images.

References: [Eyewear](#) and [Eyewear Accessories](#)

Keep your personal web site

You are to keep your personal portfolio pages (from previous Webpage Programming and Design Assignment #1) within this web site as a link pointing to the Founder's Page of the company. In addition, you need to provide a JavaScript password login before the user gains access to your resume page. The password should be set as "JavaScript" (case sensitive) by default for testing and marking purposes.

Game within your site – a memory game or other games as you wish

To attract visitors to visit the site more frequently and to make them stay longer, you are to implement a game page. As a start, you may create a memory game of matching different **eyewear** related images of your products. It is expected that the memory game should have at least 2 levels of difficulty. As such, the player can play the game according to his or her choice of difficulty:

1. Basic level, the default level is a 4 x 4 matrix. (8 pairs of matches)
2. Advanced level, scales to a 4 x 6 matrix (12 pairs of matches)

Note: Students can implement any other games but still need to provide 2 levels of difficulty.

DHTML and JavaScript techniques

The following DHTML/JavaScript effects should be implemented on your web site. However, you may include any additional effects that would make your site more attractive.

Effects on Web Pages

No.	Effect	Description
1	Top Navigational Bar	Use the appropriate technology to implement a manual that will help users to easily navigate within your site.
2	Live Clock	A live clock that show the current time and date.
3	Floating images (up and down)	A floating image that goes from bottom of the page to catch user's attention and shows some information.
4	Fade-in slideshow	An image fades away and reappears again. It then repeats the same sequence of pictures.
5	Image Rollover	Implement this with mouse events, to create effects that when mouse moves into a picture, it changes and shows another picture, when the mouse is moved away from the picture then another picture shows.
6	Dynamic Content	Pop-up message in a small web-window. Showing messages or advertisement.

Animations

You should provide at least 2 JavaScript enabled animations in any 2 of your web pages in your site. It is up to you to decide what to put within a page and what animations you want to create.

(Optional) Cookies / LocalStorage for tracking users

Provide a registration menu for the user to register to your site. Once the user has got registered then use JavaScript cookie / localStorage to indicate how many times the same user has stepped into your site during his or her subsequent visits. It is probably good to use this tracking feature on the Main Page (however, where to put it is up to you), when the user first steps into your site. Try to prompt the user to do registration when the first time he / she reaches your site. When the next time the same user steps into the site, an advertisement would be shown to him/her. It probably can be used along with effect no. 6 described above.

Write Up - Report

You are also expected to provide a report with a clear but brief explanation of the above effects (such as using flowchart, or pseudo code, or brief comments). A brief description of the design of your website including structures, logical sequences, and a brief guide for the user should also be given. State the difficulties you may have encountered and the solutions for getting round these problems should be elaborated. A reflection on what you have learnt through the web site development and future improvement should be suggested, if any. The document should be limited to a maximum total of 6 pages including screen captures. Quote any references where necessary, and please respect copyrights.

Uploading your web pages and coding

All necessary files should be zipped and uploaded to SOUL for marking purposes.

~End~
